AERO 3240 Term Assignment

Carleton University

By: Boaz Aharony

Student ID:

2022-12-07

Notes

All figures, code attachments, tables, code lines, and section references are clickable and will bring you to said reference. As well all 2-D plots are vectored images that allow unlimited zoom-in.

Contents

List of Figures

List of Tables

List of MATLAB Code Attachments

2 Two-Body Problem

2.5 Speed and Periods of Circular LEO

Created using code attachment 1 in Appendix A.

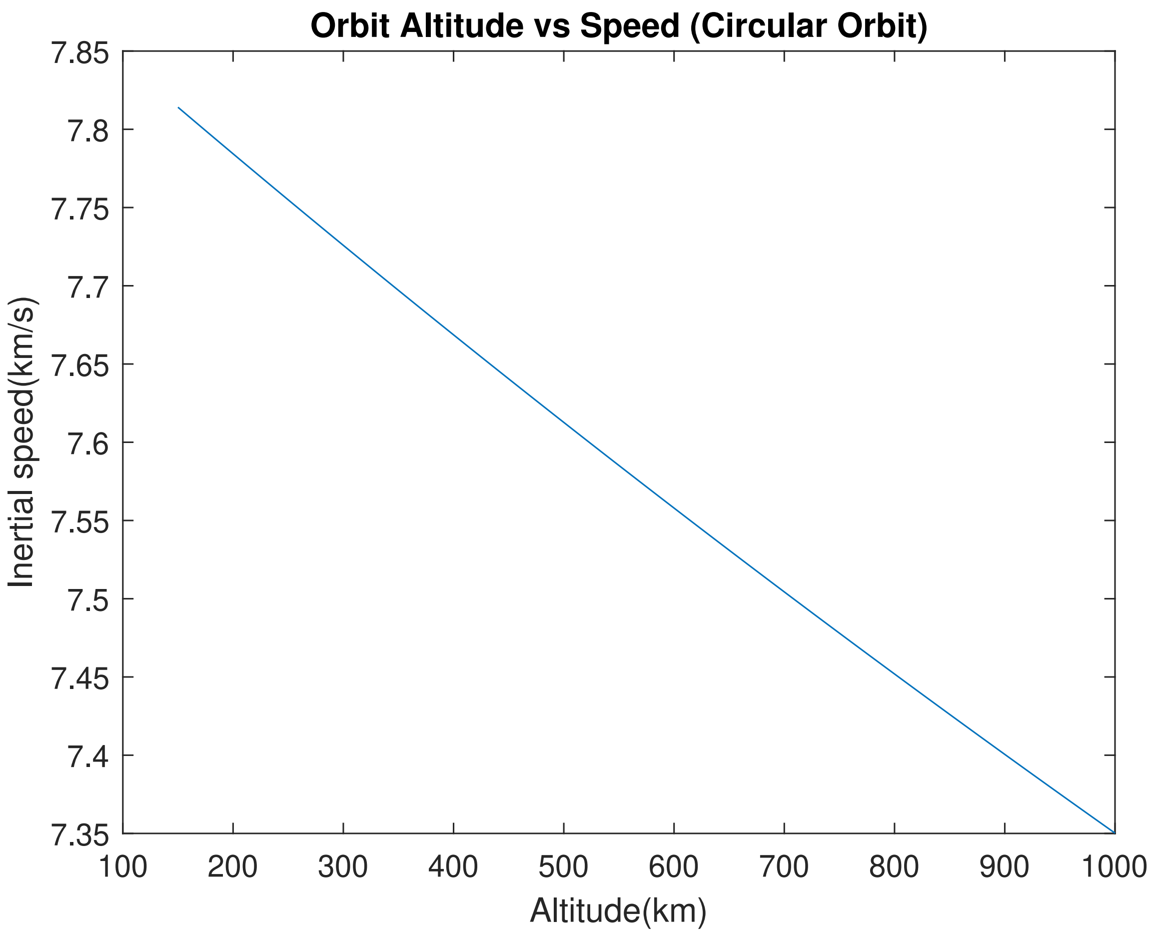

Figure 1: Orbital Speed vs Altitude

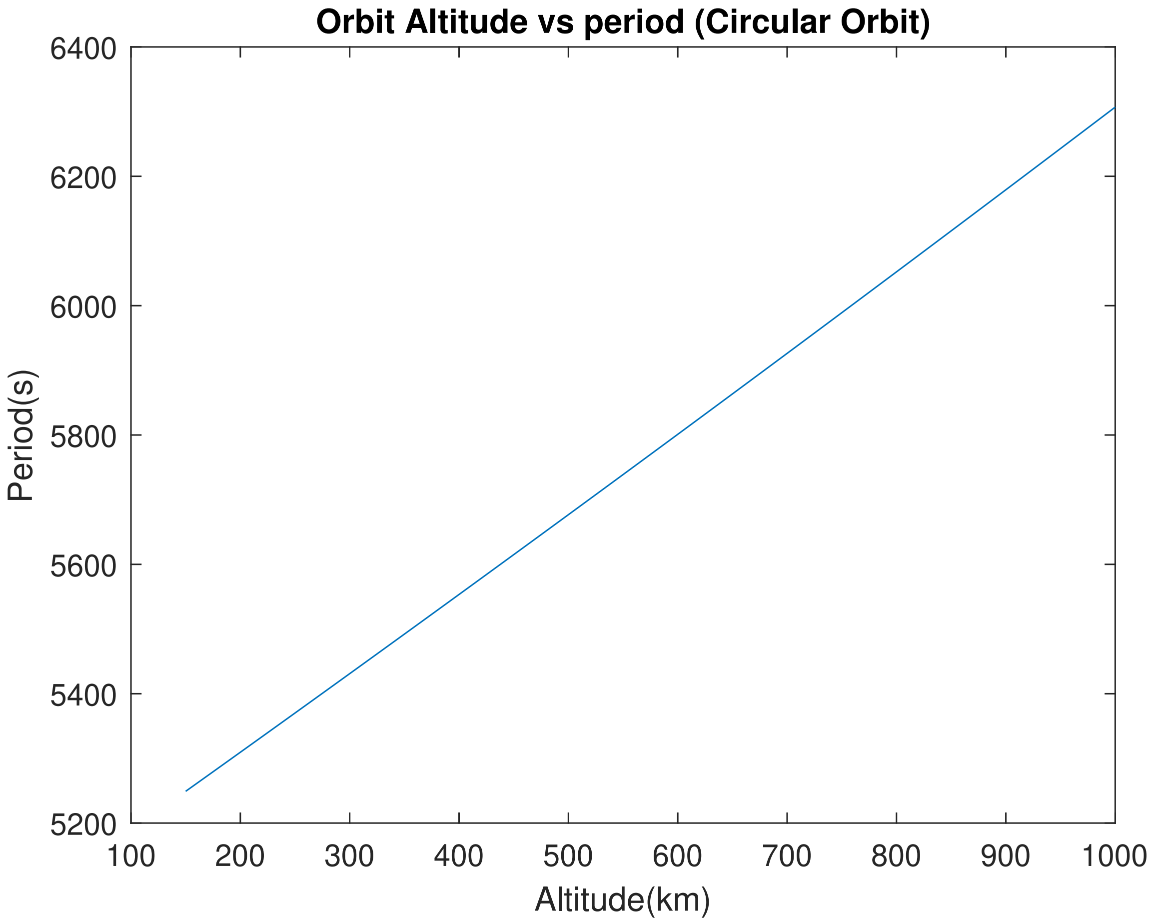

Figure 2: Orbital Period vs Altitude

2.13 PROBA-2 Without Perturbations

Created using `MATLAB` code and `SIMULINK` diagrams found in Appendix B.

2.13 a Plot of Orbit in the Orbital Plane

Created using code attachment 2 after line 65

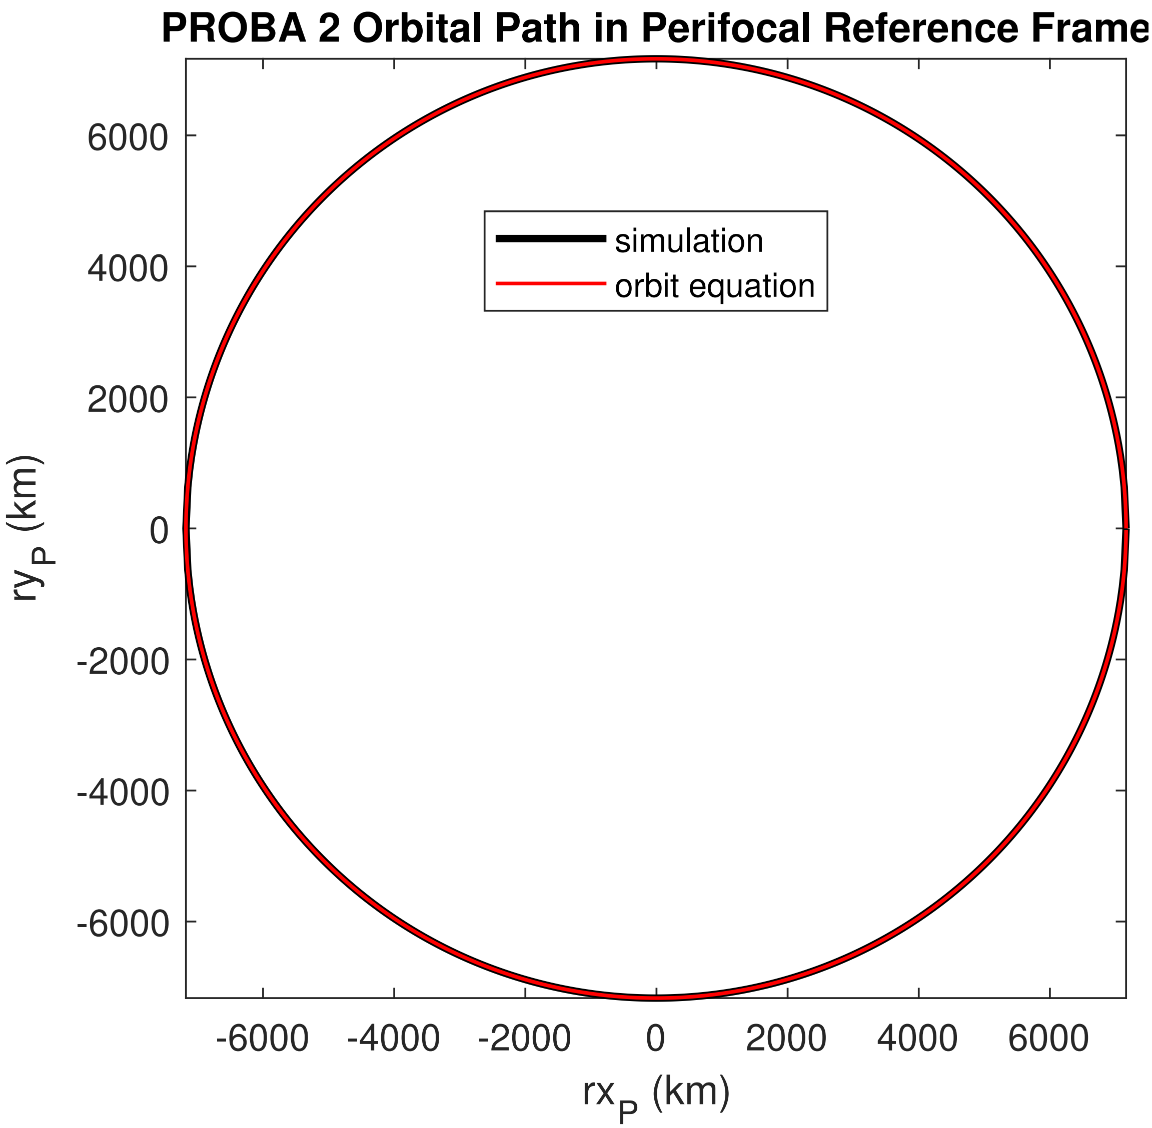

Figure 3: PROBA-2 Orbit in Perifocal Frame

2.13 b Initial Conditions For SIMULINK Integrators

Calculated in code attachment 2 after line 42 using rotation matrix functions found in appendix E.1

Table 1: Table of Initial PROBA-2 Position and Velocity

Component	$\mathbf{r}_{I,initial}$**(km)**	$\mathbf{v}_{I,initial}$**(km/s)**
X	0.0000	-1.0749
Y	-7.1618×10^3	0.0000
Z	0.0000	7.3862

2.13 c 3D plot of Orbit

An animation of one orbit cycle can be viewed by clicking this **youtube link** (done using attachment 12, does not show earth's spin)

The figure below was created using code attachment 2 after line 111

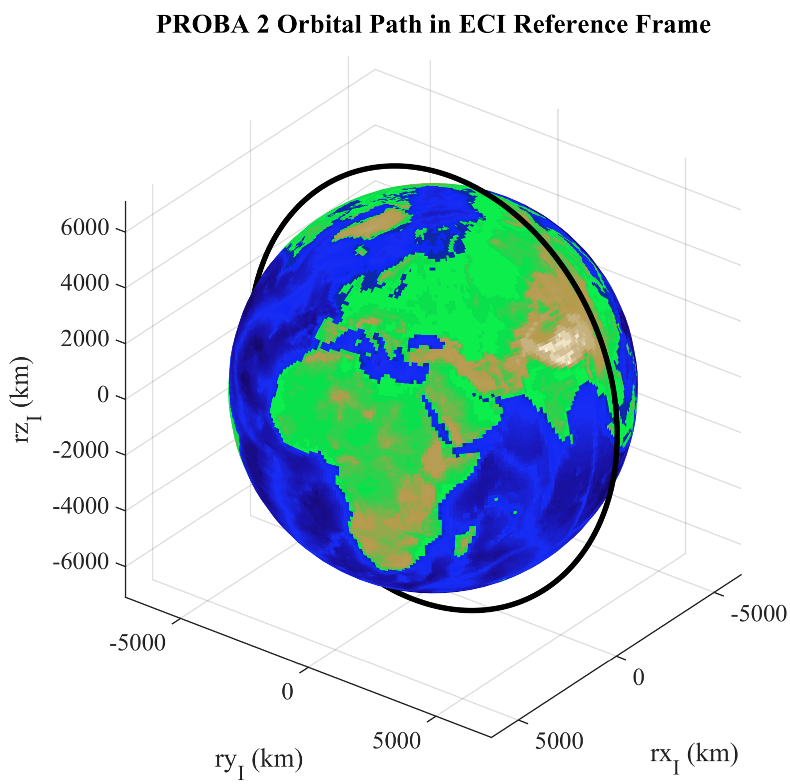

Figure 4: 3-D Plot of PROBA-2 Orbit Around Earth

2.13 d Components of Position and Velocity in ECIF

Created using code attachment 2 after line 139

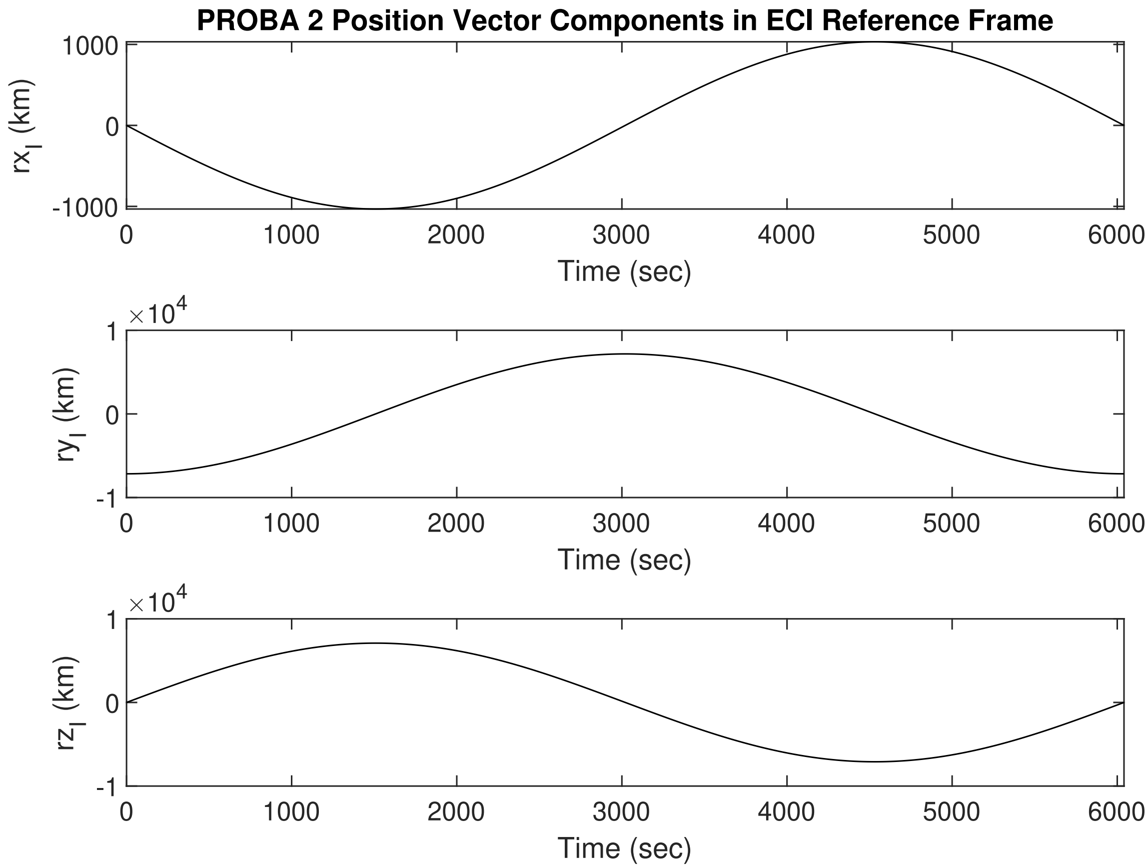

Figure 5: PROBA-2 Components of Position

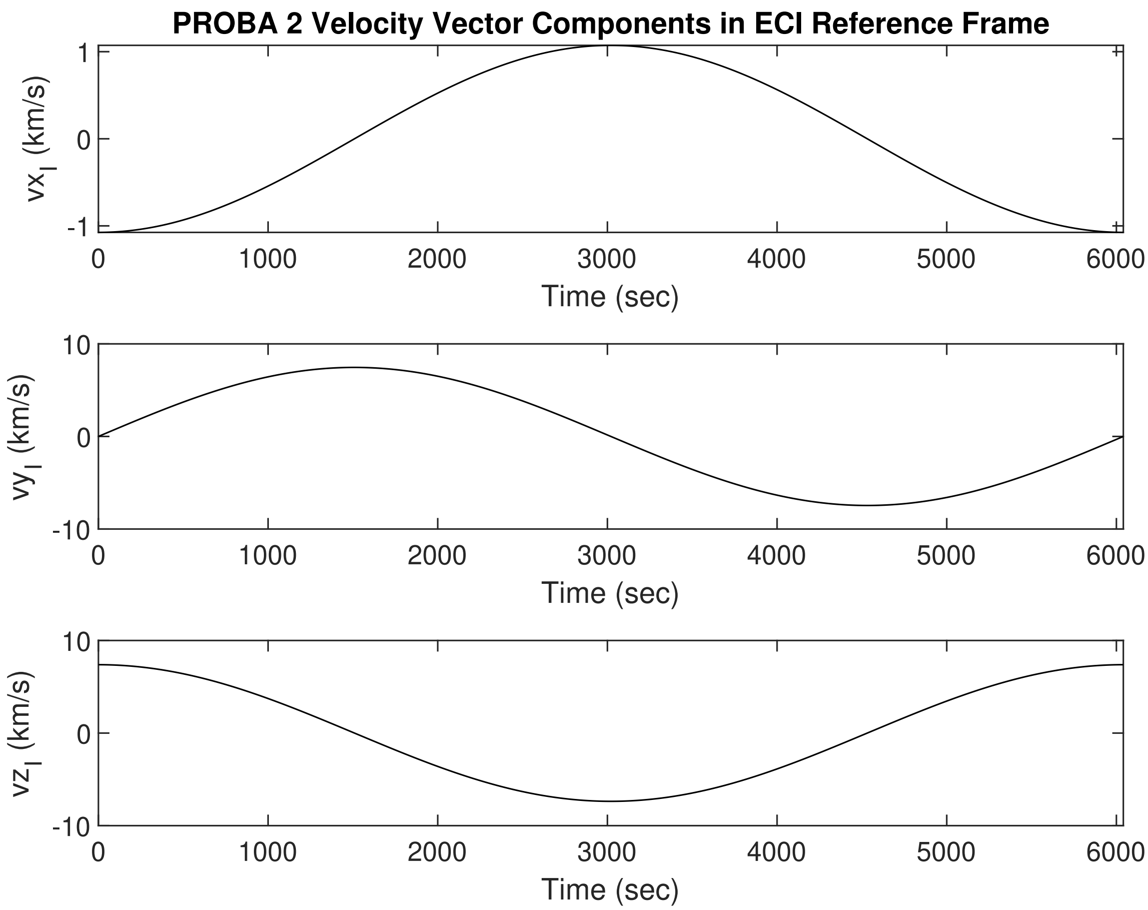

Figure 6: PROBA-2 Components of Velocity

2.13 e Radius and Speed in ECIF

Created using code attachment 2 after line 191

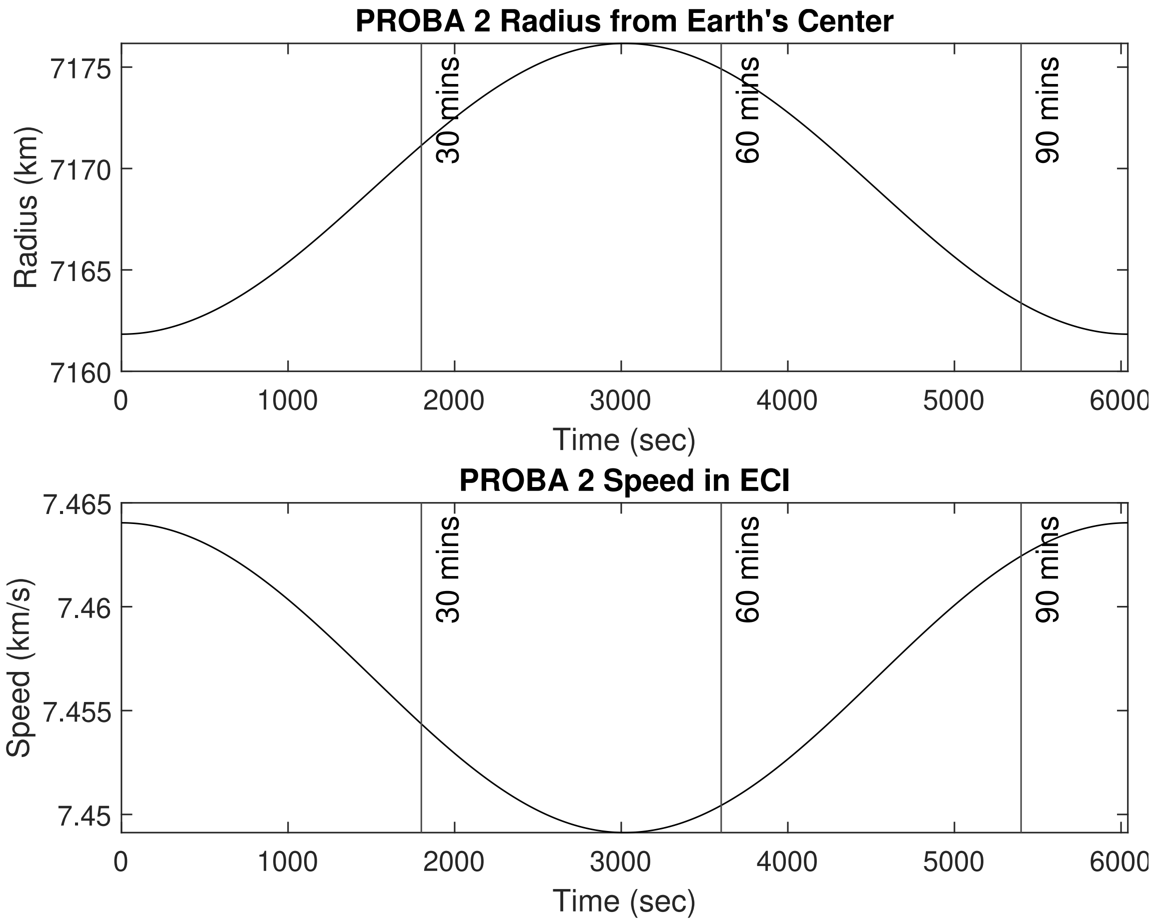

Figure 7: PROBA-2 Radius and Speed

Using the Vis-Viva equation as a function of radius r for a constant semi-major axis a the velocity at any point is determined by eq. 1

$$v = \sqrt{\mu\left(\frac{2}{r} - \frac{1}{a}\right)} \tag{1}$$

The radius was determined in code by finding the position in the array of the closest time point and taking its radius, which was visually compared with the above graphs. To verify the graphs, the results compared to eq. 1 are confirmed in table 2:

Table 2: Table of comparison between simulation and vis-viva results

Time (minutes)	$\mathbf{r}_I$**(km)**	**Calculated** $\mathbf{v}_I$**(km/s)**	**Simulated** $\mathbf{v}_I$**(km/s)**
30	7.1711×10^3	7.4544	7.4544
60	7.1749×10^3	7.4504	7.4504
90	7.1634×10^3	7.4624	7.4624

2.13 f Ground Plots

Video animated ground tracks are available by clicking this **youtube link** (done using attachment 13) As well as the plot below which was created using code attachment 2 after line 252:

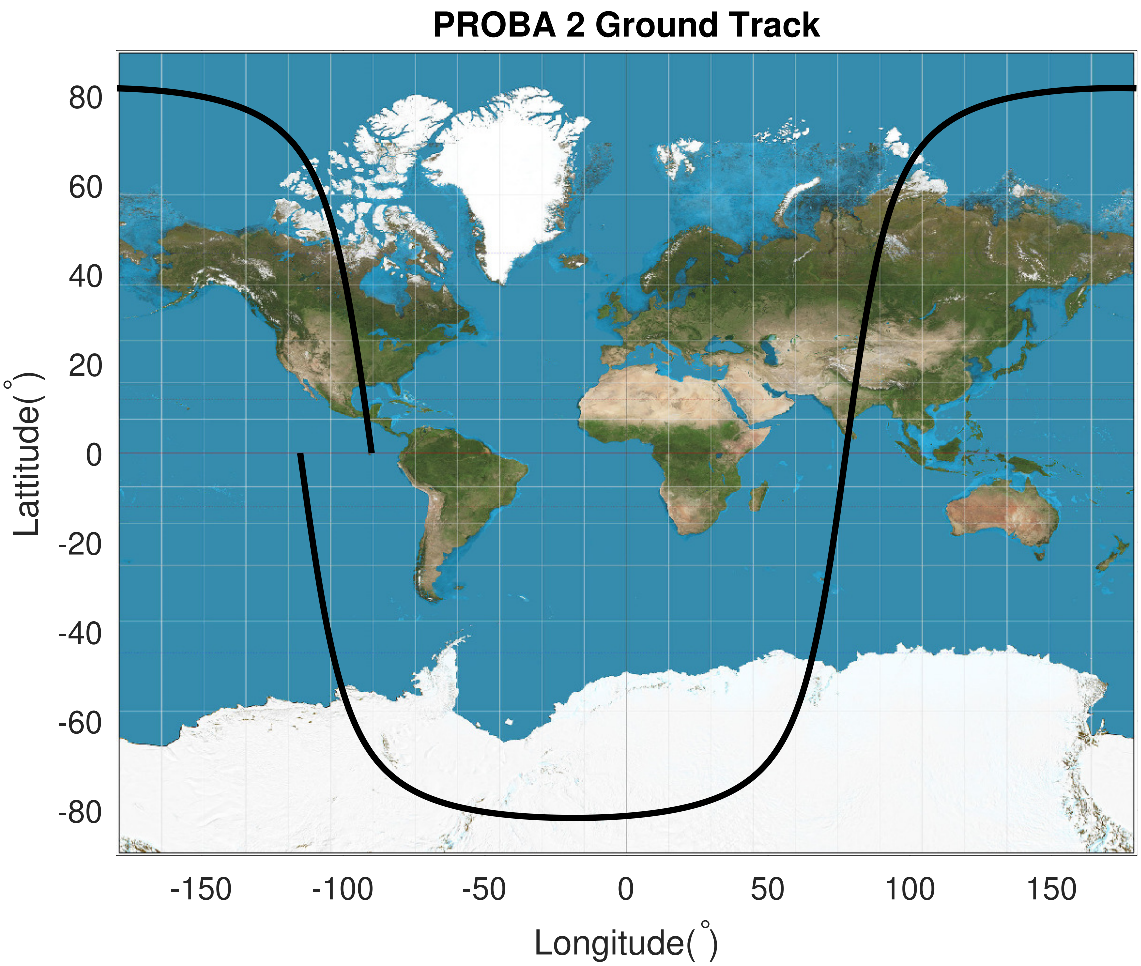

Figure 8: PROBA-2 ground tracks

3 Orbital Pertubations

3.1 PROBA-2 with Pertubations

Created using `MATLAB` code and `SIMULINK` diagrams found in Appendix C.

3.1 a Calculated Secular and Average Rate of Change

To determine the expected secular change in RAAN eq. 2 is used

$$\Delta\Omega = -\frac{3\pi J_2 R_\oplus^2}{p^2}\cos(i) \tag{2}$$

To determine the expected average rate of change eq. 3 is used:

$$\langle\dot{\Omega}\rangle = -\frac{3J_2 R_\oplus^2}{2p^2} n \cos(i) \tag{3}$$

This is calculated in section A of `MATLAB` code attachment 5 after line 73. It is tabulated in Tables 3 and 4 for inclinations of 98.28° and 10° respectively. These tables are found in 3.1 e.

3.1 b Simulating with $\mathbf{J}_2$

The simulation was done by adding the J_2 perturbation function in code attachment 6 to the `SIMULINK` diagram Figure 27 as a function block and summation with the acceleration caused by the two-body-problem. The main script attachment 5 uses the simulation for the rest of the question.

3.1 c Plot of Change in RAAN

Done in code attachment 5 after line 81

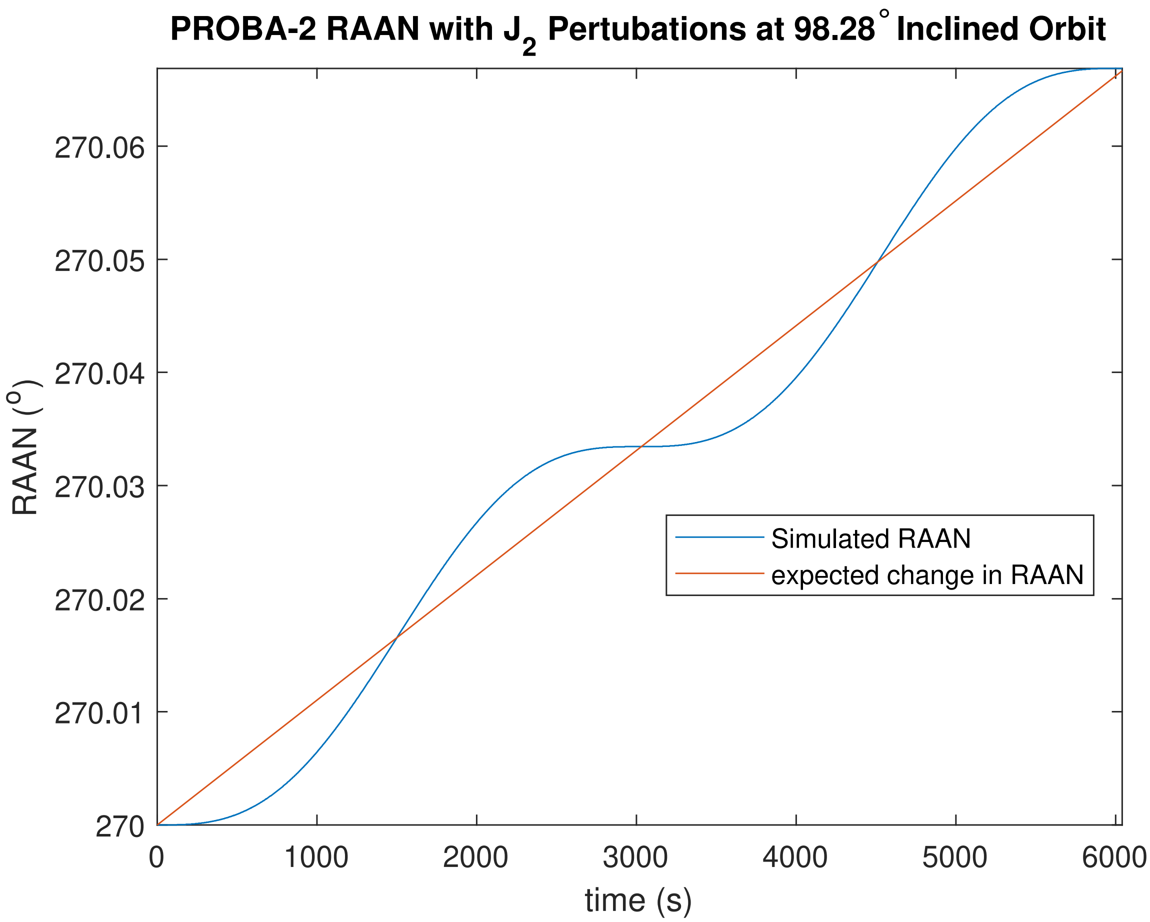

Figure 9: PROBA-2 Change in RAAN at 98.28° inclination

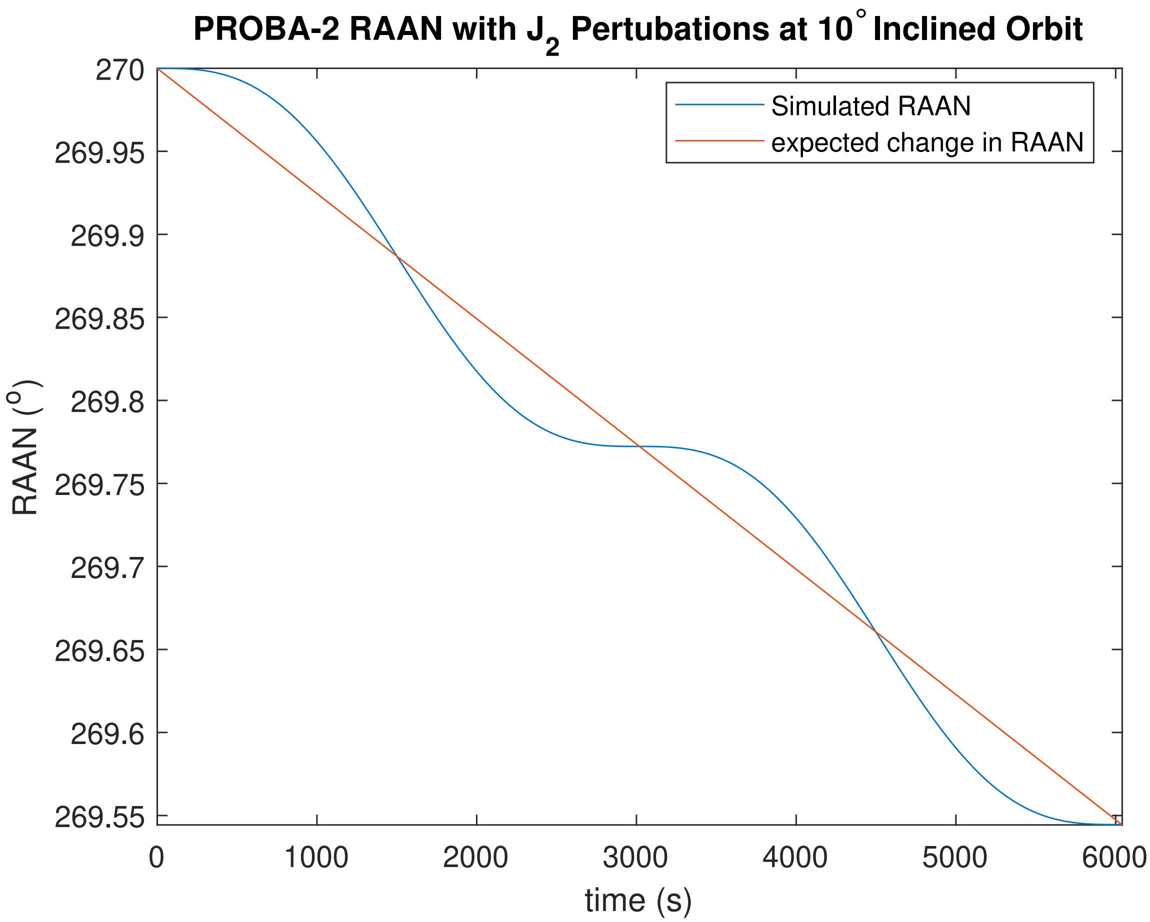

Figure 10: PROBA-2 Change in RAAN at 10° inclination

3.1 d Interpretation of Change in RAAN from Simulation

Calculated after line 113 of `MATLAB` code attachment 5 and tabulated in Tables 3 and 4 for inclinations of 98.28° and 10° respectively. These tables are found in 3.1 e.

3.1 e Comparison of Expected and Simulated Secular and Rate of Change in RAAN

Done in code attachment 5 after line 126

Table 3: Table of comparison between simulation and calculated RAAN results for inclination of 98.28°

	secular change (°/rev)	**average rate of change(°/s)**
expected	$6.6639{\times}10^{-2}$	$1.1031{\times}10^{-5}$
simulation	$6.6876{\times}10^{-2}$	$1.1071{\times}10^{-5}$
difference	$2.3773{\times}10^{-4}$	$3.9353{\times}10^{-8}$

Table 4: Table of comparison between simulation and calculated RAAN results for inclination of 10°

	secular change (°/rev)	**average rate of change(°/s)**
expected	$-4.5570{\times}10^{-1}$	$-7.5437{\times}10^{-5}$
simulation	$-4.5547{\times}10^{-1}$	$-7.5398{\times}10^{-5}$
difference	$2.3206{\times}10^{-4}$	$3.8416{\times}10^{-8}$

3.1 f Repeat for 10° Inclination

The repeat is done in Figure 10 and Table 4 by changing the initial i (inclination) value in code attachment 5 on line 29.

5 Spacecraft Formation Flying

5.1 Envisat Formation

5.1 f Confirmation of Answers with `MATLAB`

Created using code attached in Appendix D

5.1 f i Along-Track Formation

Initial conditions in table 5 are calculated in code attachment 7 after line 47.

Table 5: Table of initial formation conditions (along-track formation)

$\mathbf{v_{x_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{y_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{z_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{x_0}$(km)	$\mathbf{y_0}$(km)	$\mathbf{z_0}$(km)
0.000	0.000	0.000	0.000	-1.000×10^1	0.000

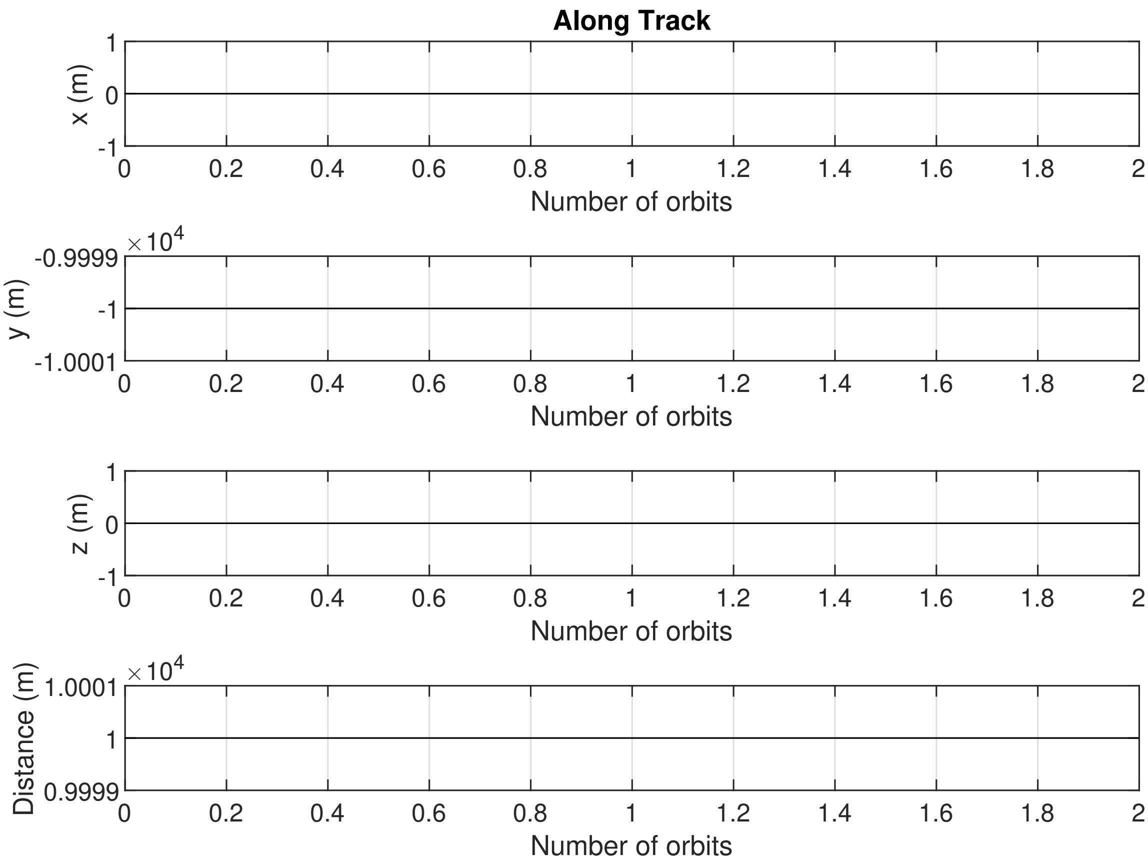

Figure 11: Position component plots (along-track formation)

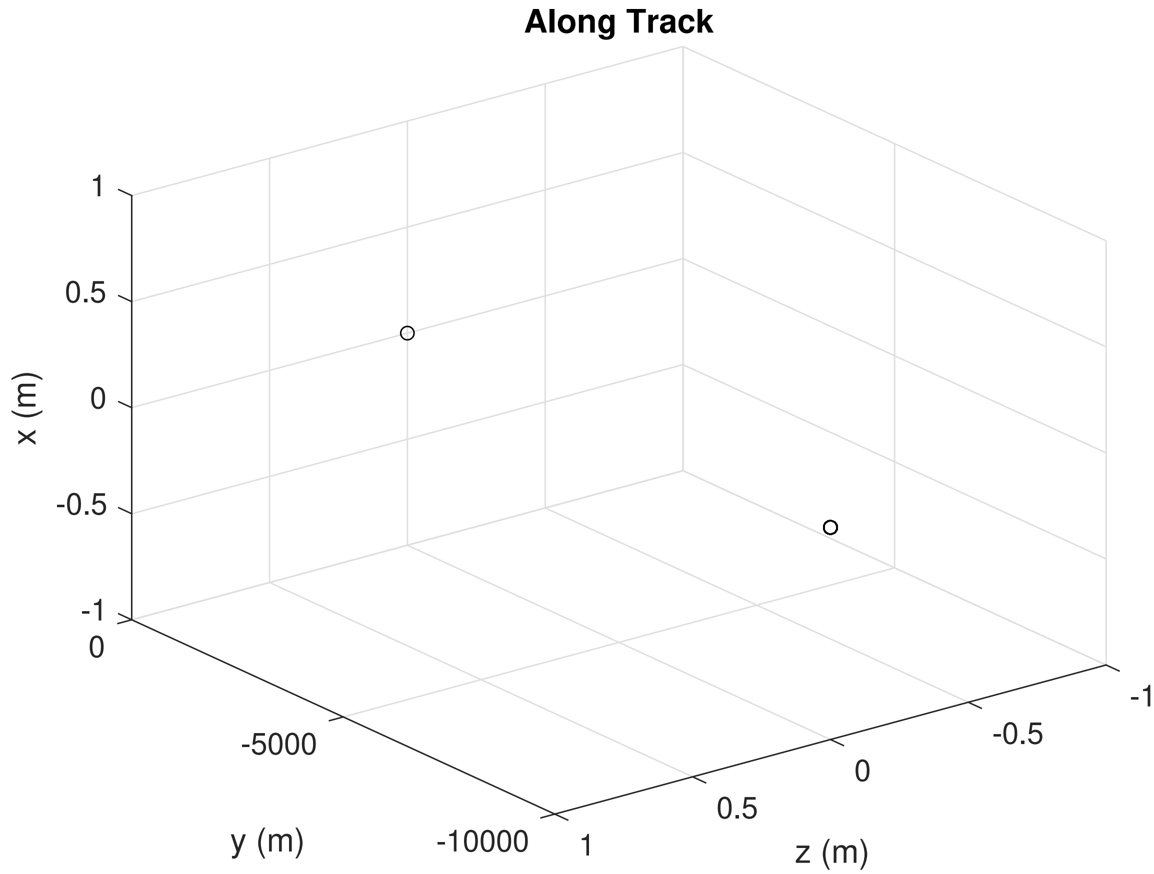

Figure 12: 3D-plot of path around target (along-track formation)

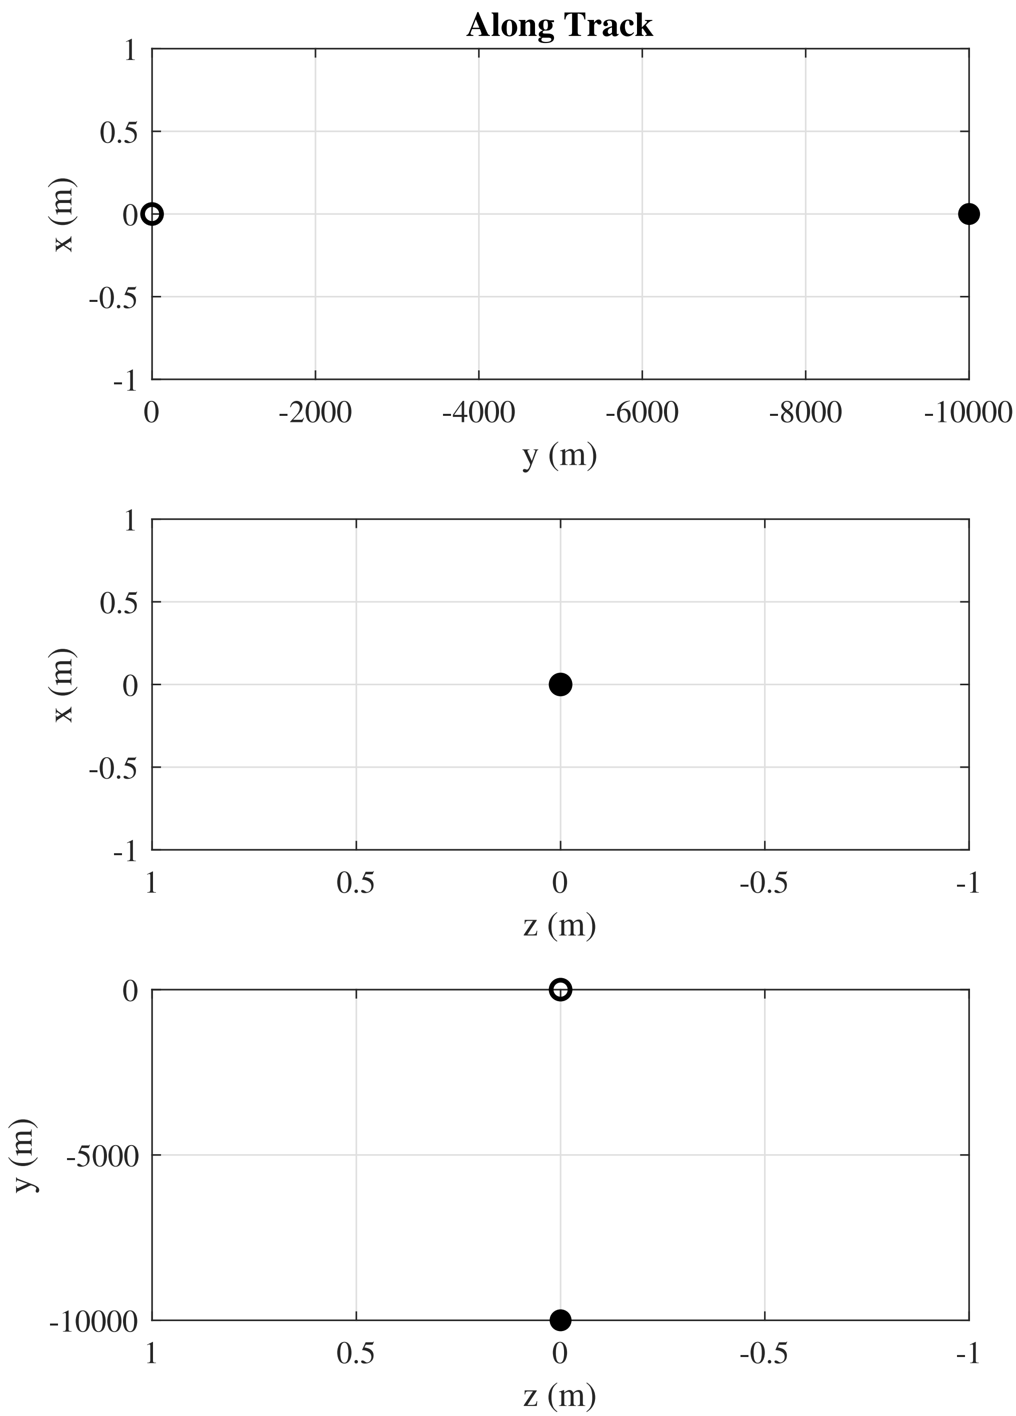

Figure 13: Path in projected planes (along-track formation)

5.1 f ii In-Track Formation

Initial conditions in table 6 are calculated in code attachment 7 after line 57.

Table 6: Table of initial formation conditions (in-track formation)

$\mathbf{v_{x_0}}\left(\frac{\mathrm{km}}{\mathrm{s}}\right)$	$\mathbf{v_{y_0}}\left(\frac{\mathrm{km}}{\mathrm{s}}\right)$	$\mathbf{v_{z_0}}\left(\frac{\mathrm{km}}{\mathrm{s}}\right)$	$\mathbf{x_0}(\mathrm{km})$	$\mathbf{y_0}(\mathrm{km})$	$\mathbf{z_0}(\mathrm{km})$
0.000	0.000	0.000	0.000	-1.000×10^{1}	6.900×10^{-1}

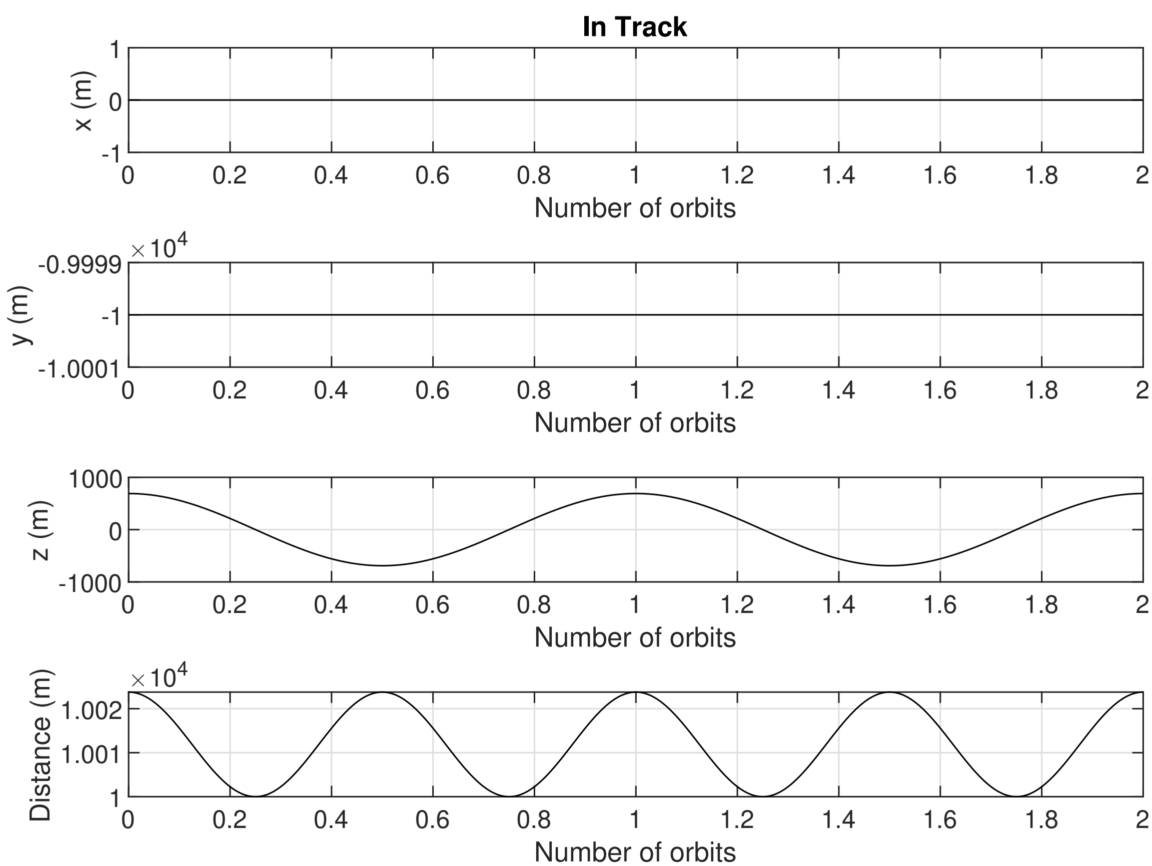

Figure 14: Position component plots (in-track formation)

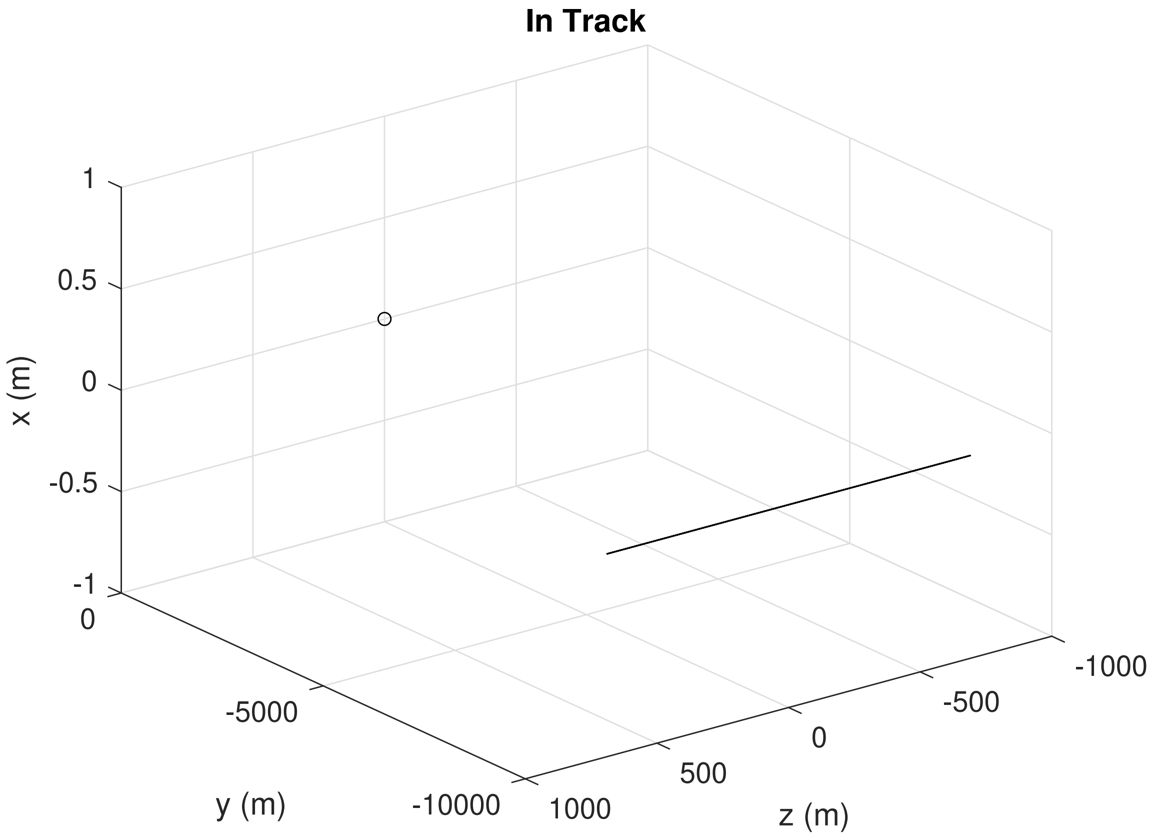

Figure 15: 3D-plot of path around target (in-track formation)

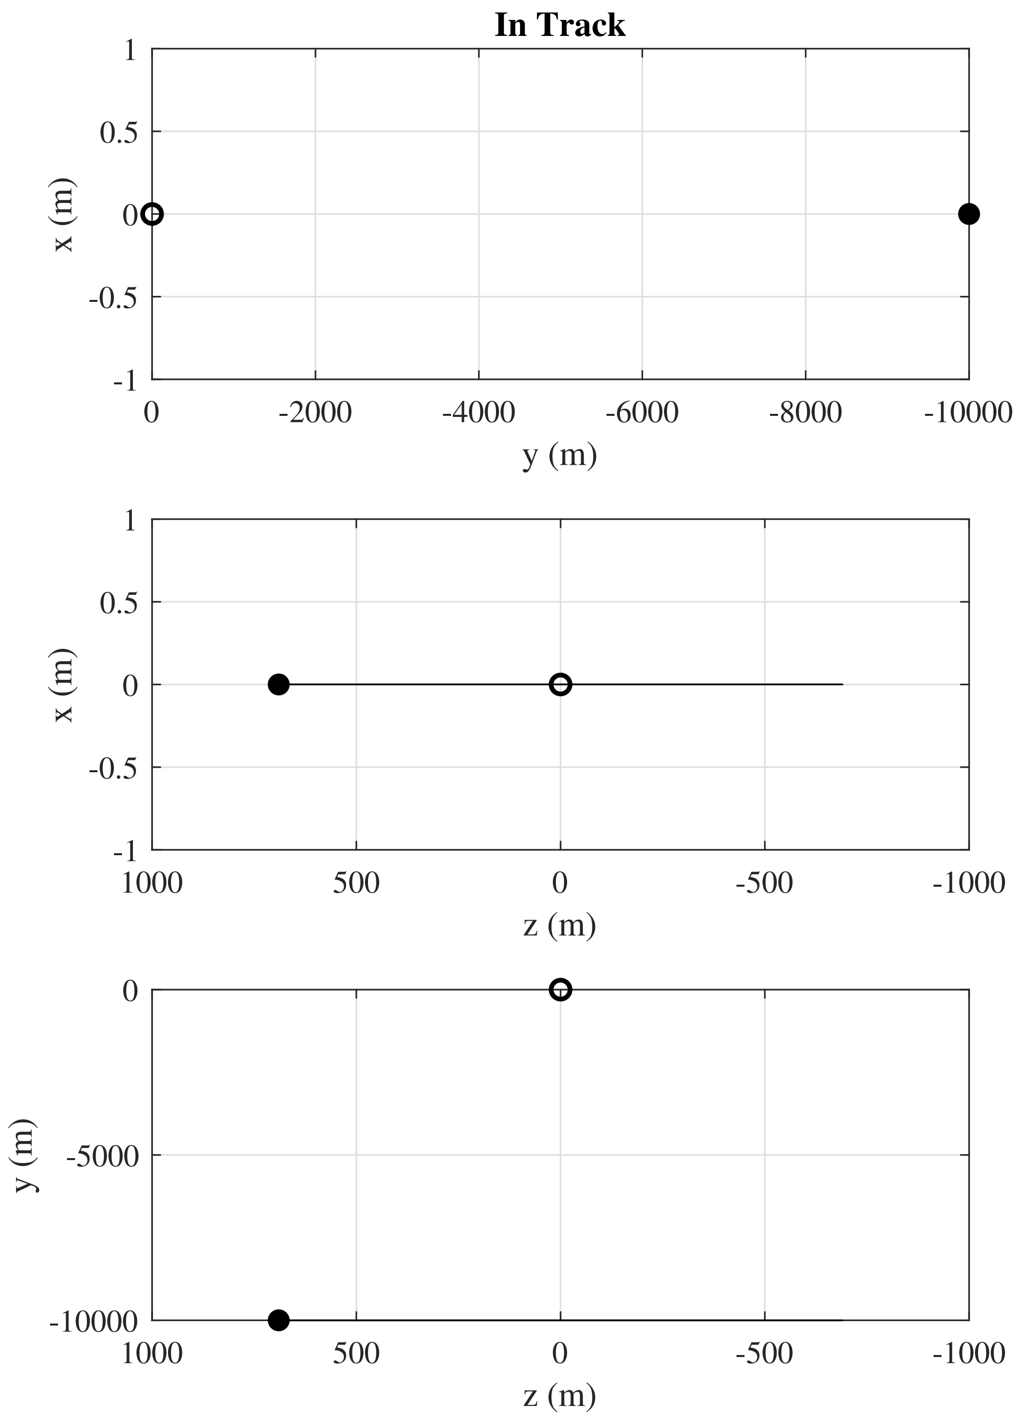

Figure 16: Path in projected planes (in-track formation)

5.1 f iii In-Plane Elliptical Formation

Initial conditions in table 7 are calculated in code attachment 7 after line 67.
Assuming initial phase angle $\alpha = 0$ for initial conditions in table 7.

Table 7: Table of initial formation conditions (in-plane elliptical formation)

$\mathbf{v_{x_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{y_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{z_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{x_0}$(km)	$\mathbf{y_0}$(km)	$\mathbf{z_0}$(km)
0.000	-5.228×10^{-4}	0.000	2.500×10^{-1}	0.000	0.000

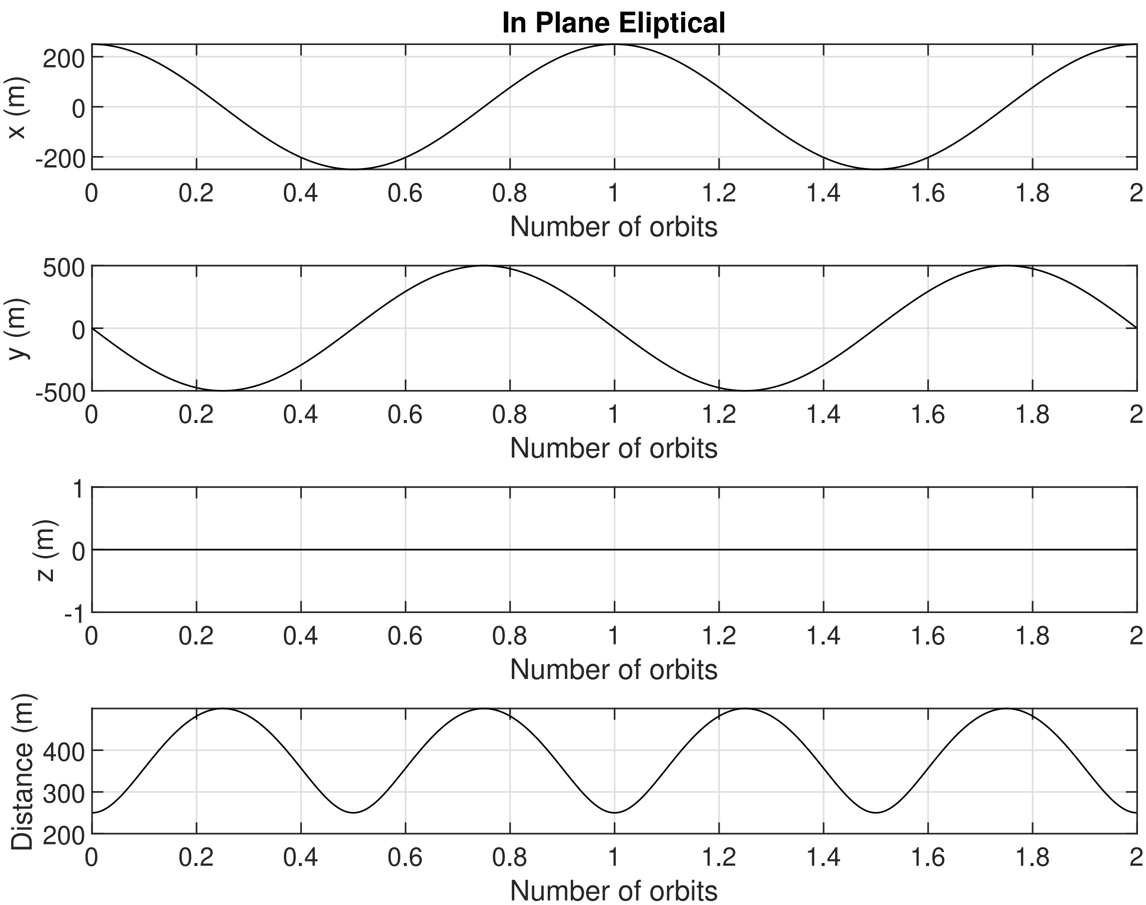

Figure 17: Position component plots (in-plane elliptical formation)

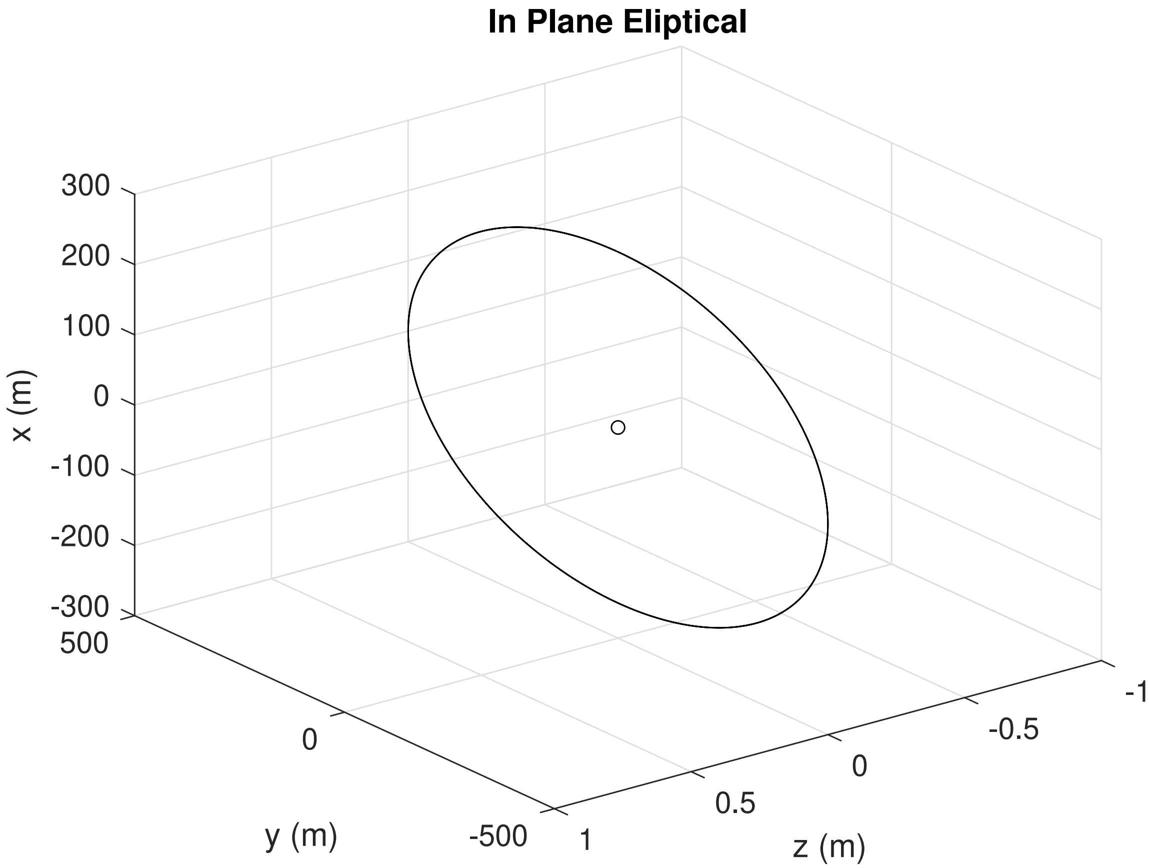

Figure 18: 3D-plot of path around target (in-plane elliptical formation)

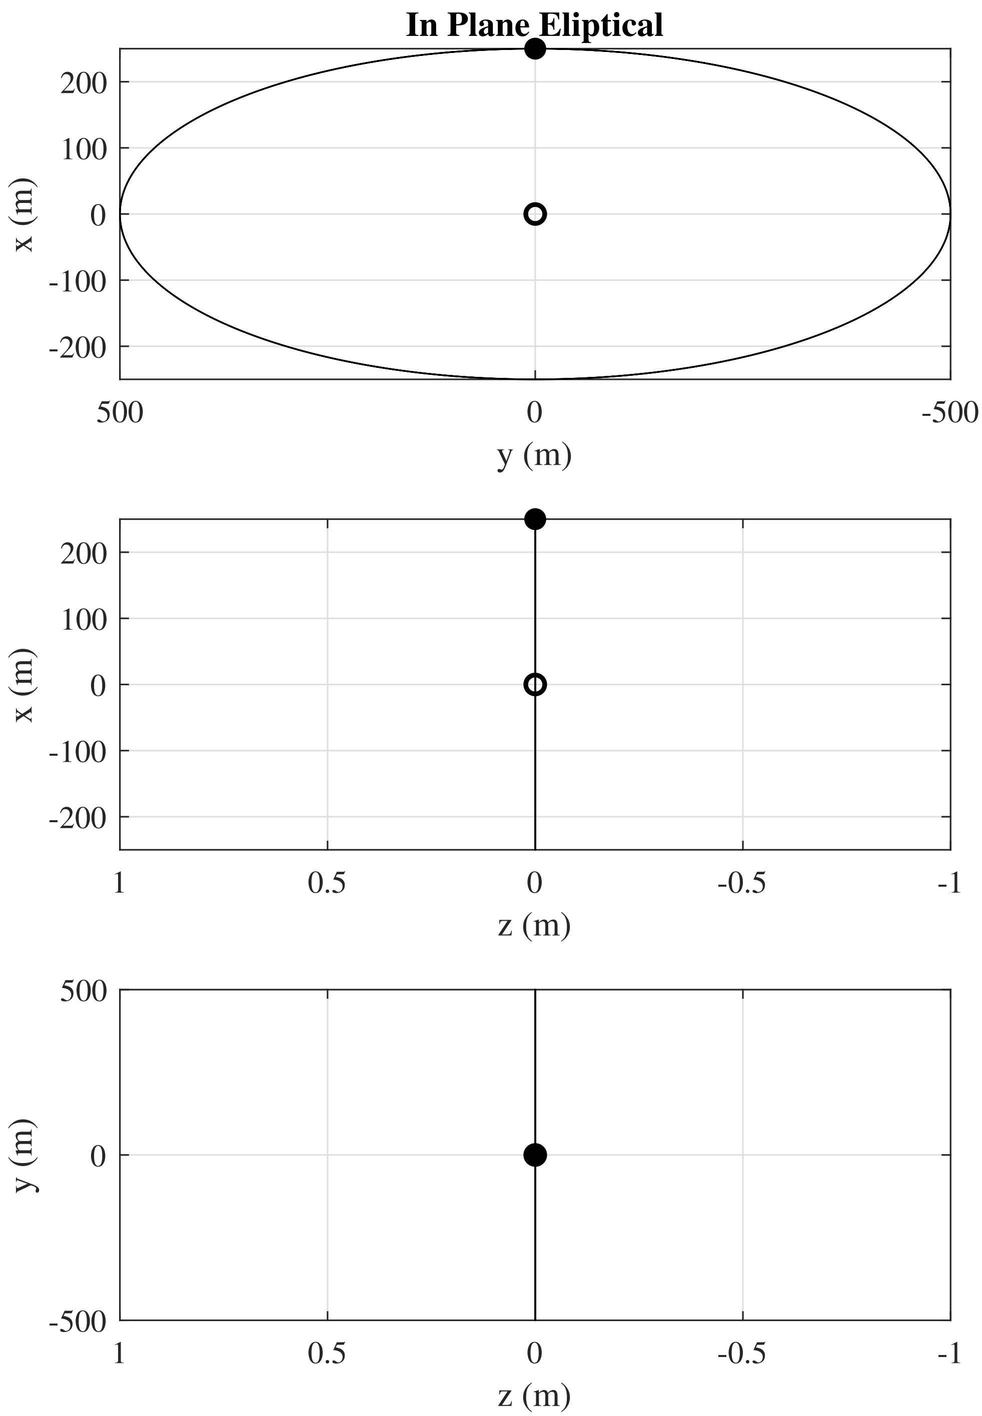

Figure 19: Path in projected planes (in-plane elliptical formation)

5.1 f iv Circular Formation

Initial conditions in table 8 are calculated in code attachment 7 after line 89.

Table 8: Table of initial formation conditions (circular formation)

$\mathbf{v_{x_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{y_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{z_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{x_0}$(km)	$\mathbf{y_0}$(km)	$\mathbf{z_0}$(km)
0.000	-2.091×10^{-5}	0.000	1.000×10^{-2}	0.000	1.732×10^{-2}

$\mathbf{z_0}$ and $\mathbf{v_{z_0}}$ in table 8 can also be negated and achieve the same formation type.

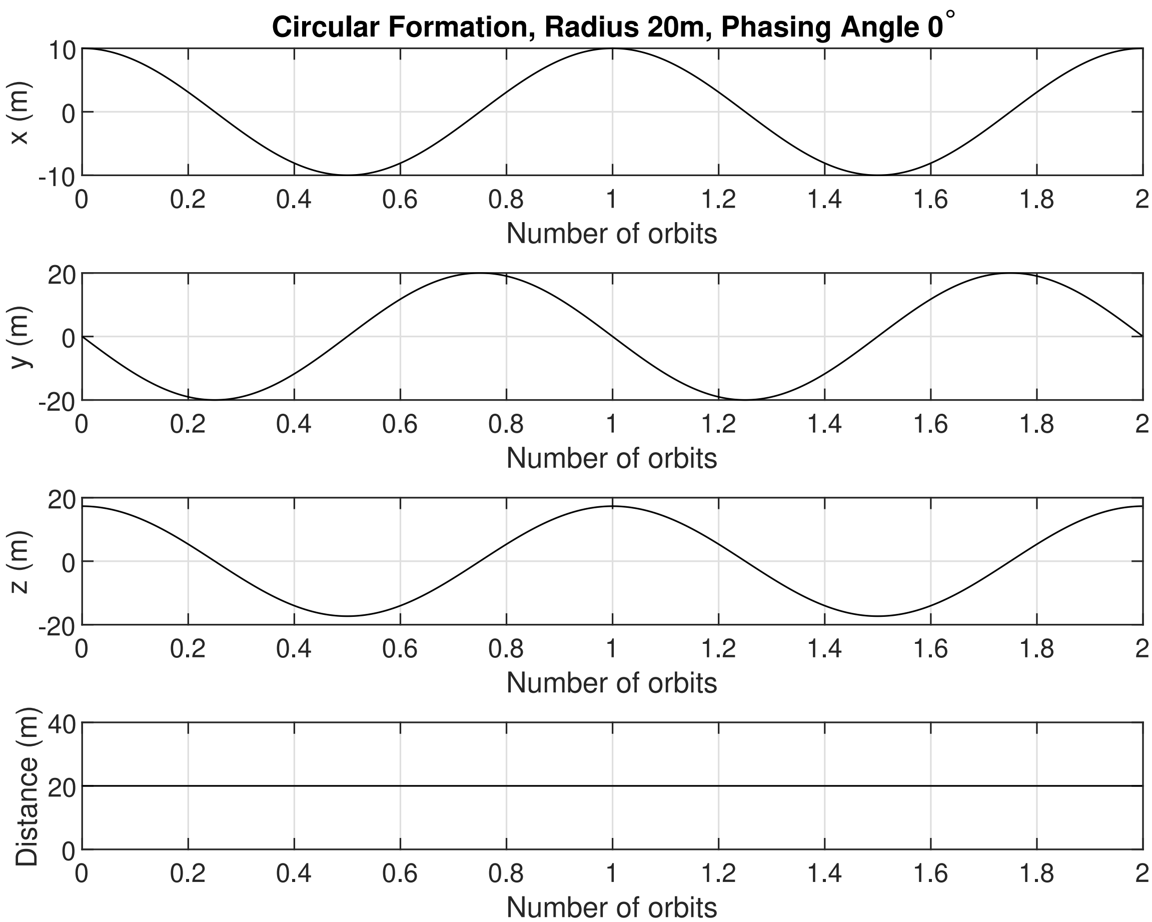

Figure 20: Position component plots (circular formation)

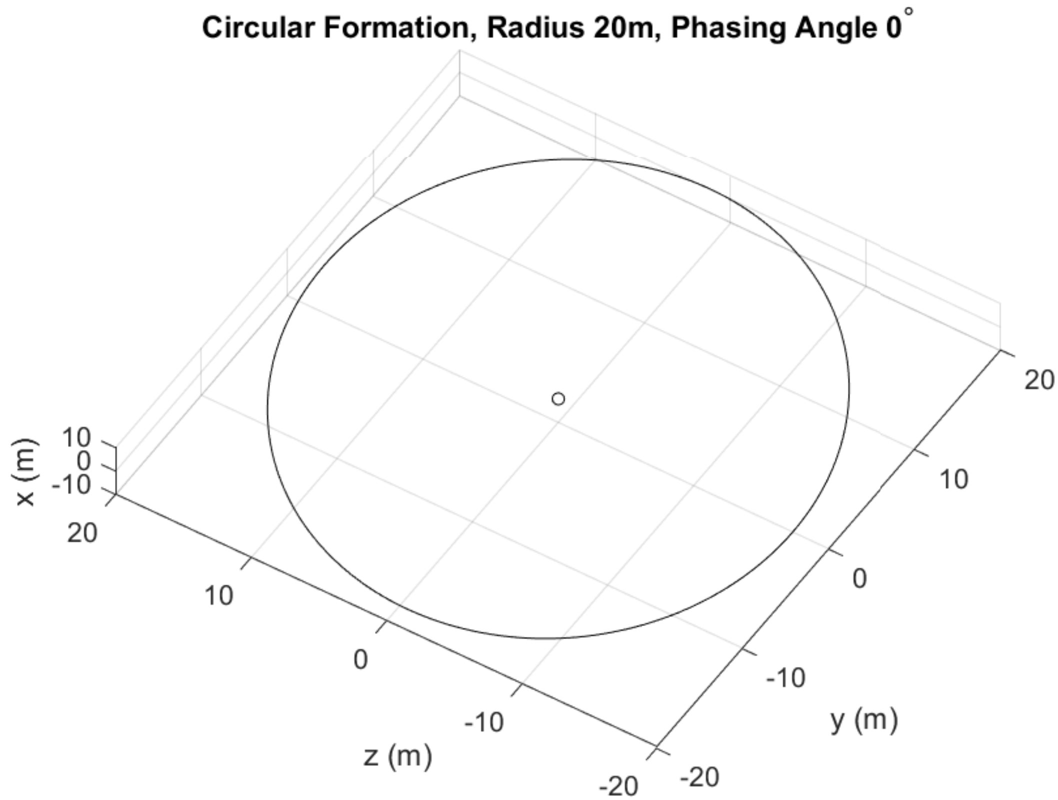

Figure 21: 3D-plot of path around target (circular formation)

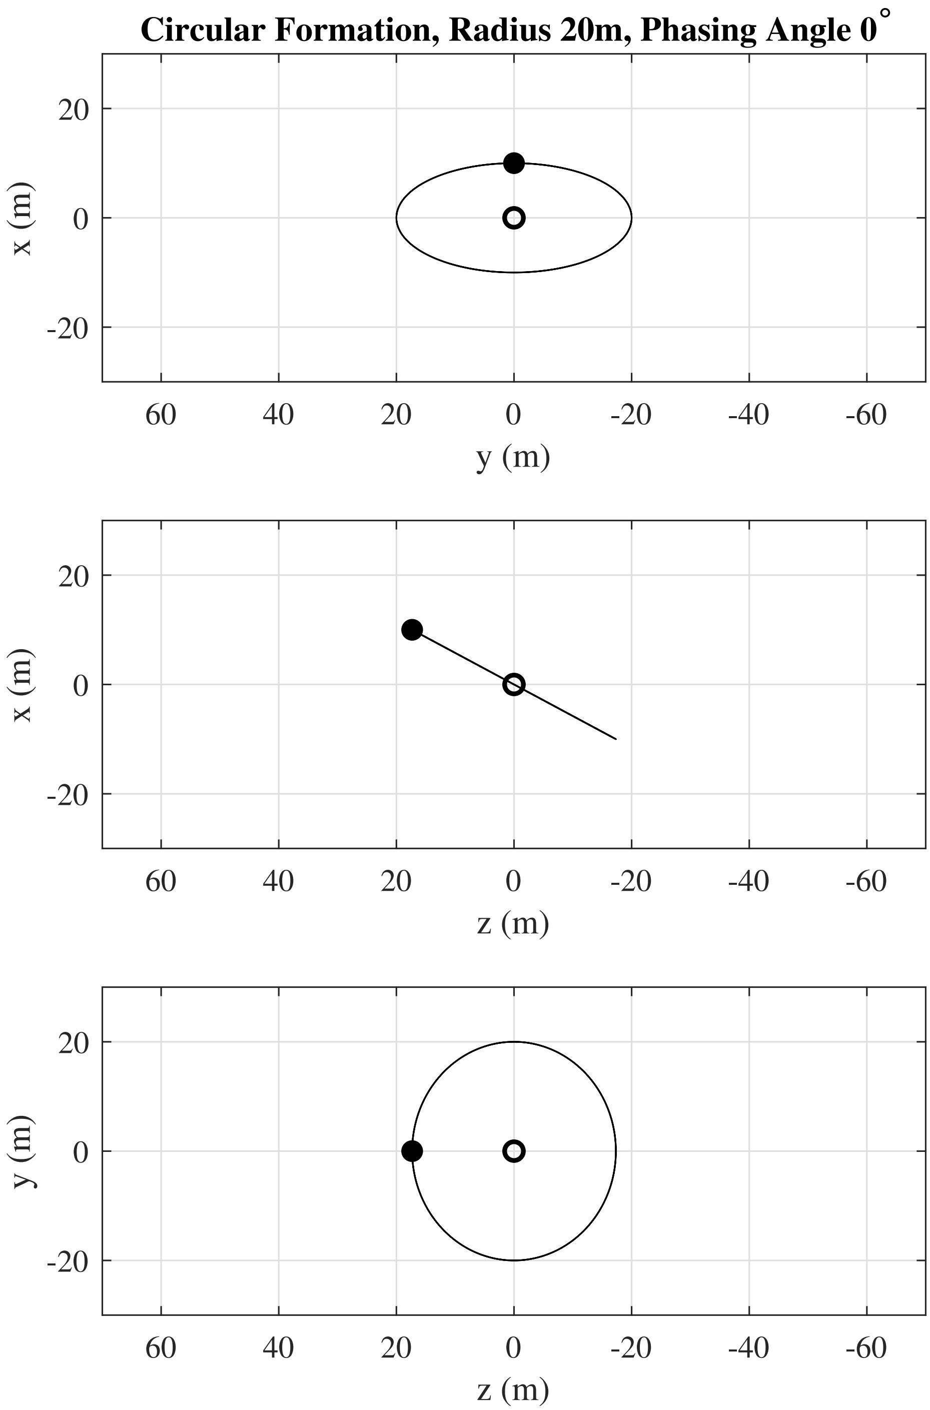

Figure 22: Path in projected planes (circular formation)

5.1 f v Projected Circular Formation

Initial conditions in table 9 are calculated in code attachment 7 after line 102.

Table 9: Table of initial formation conditions (projected circular formation)

$\mathbf{v_{x_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{y_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{v_{z_0}}\left(\frac{\text{km}}{\text{s}}\right)$	$\mathbf{x_0}$(km)	$\mathbf{y_0}$(km)	$\mathbf{z_0}$(km)
1.046×10^{-5}	0.000	2.091×10^{-5}	0.000	2.000×10^{-2}	0.000

$\mathbf{z_0}$ and $\mathbf{v_{z_0}}$ in table 9 can also be negated and achieve the same formation type.

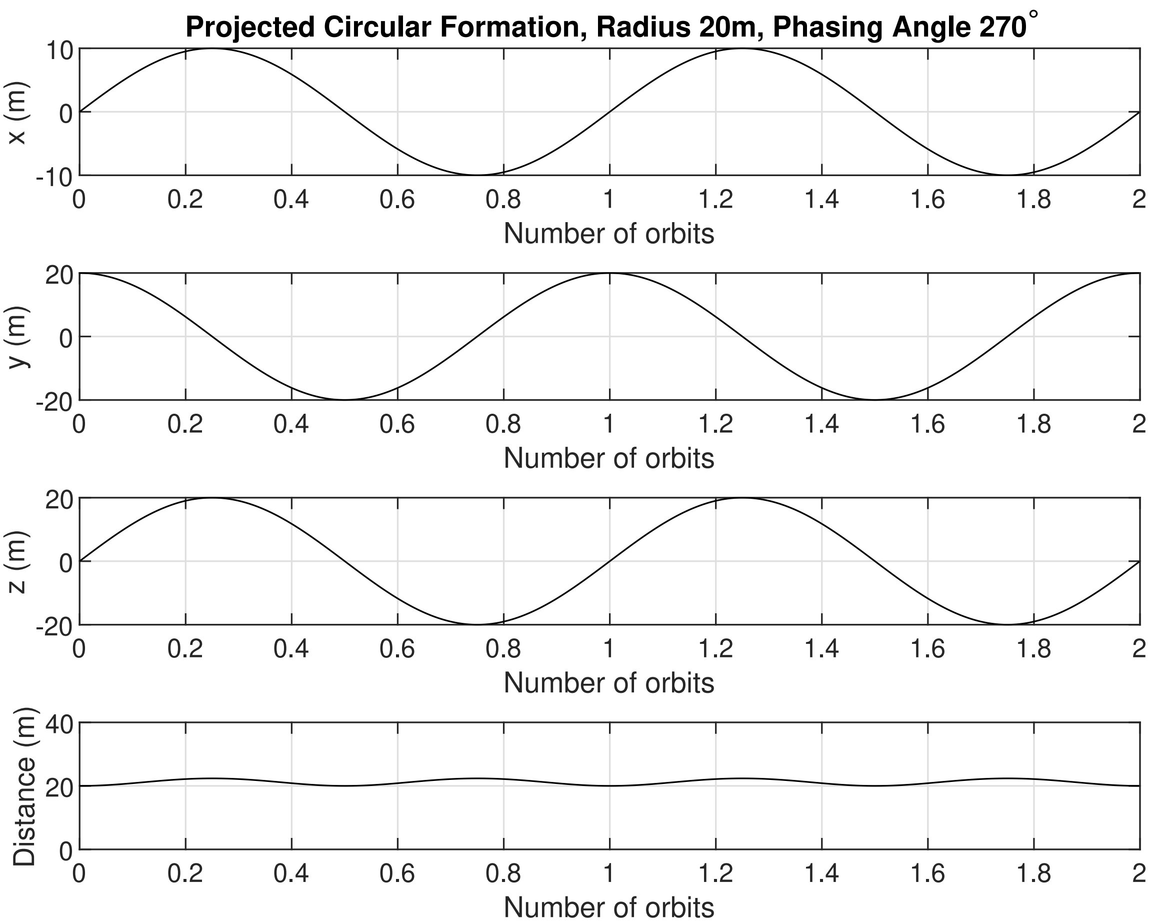

Figure 23: Position component plots (projected circular formation)

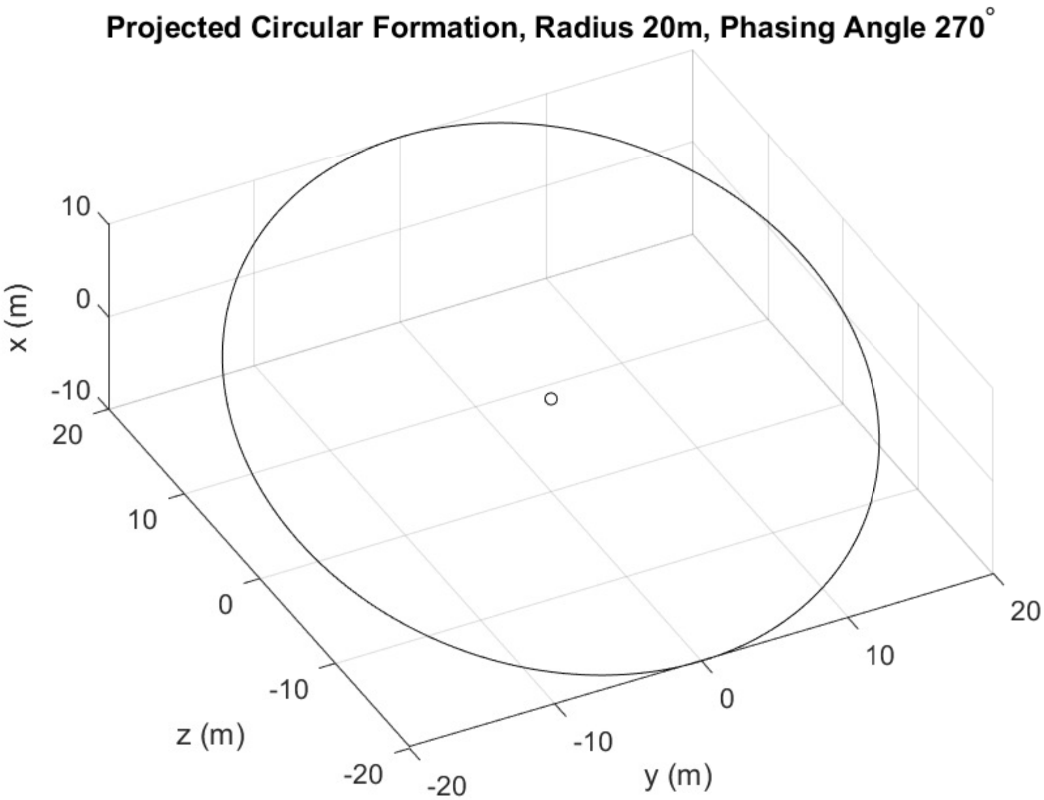

Figure 24: 3D-plot of path around target (projected circular formation)

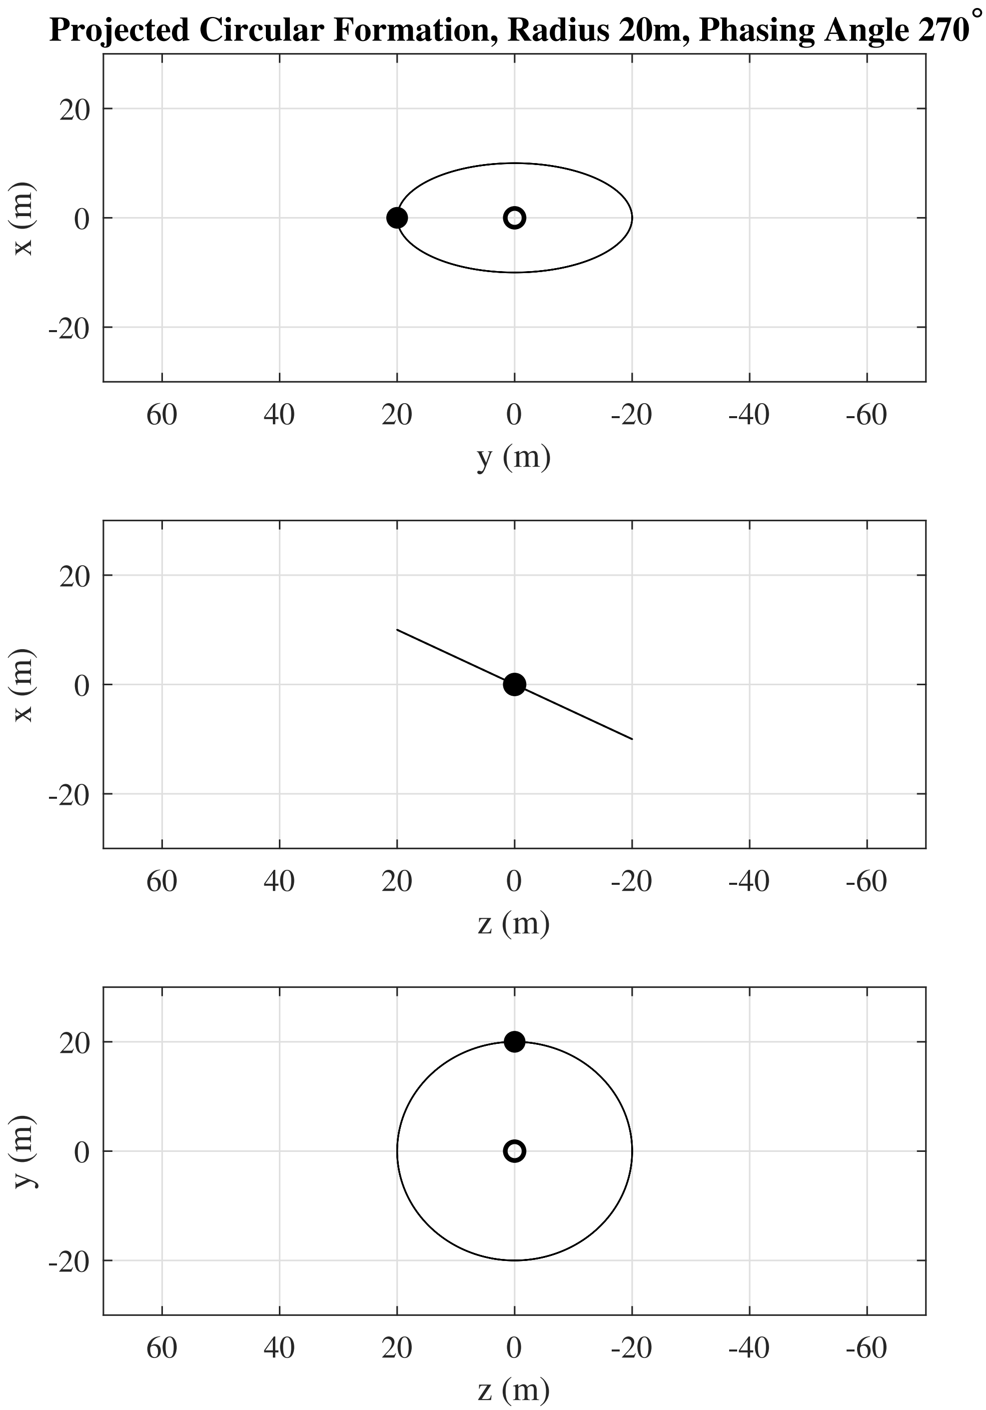

Figure 25: Path in projected planes (projected circular formation)

C.3 a J_2 Perturbation acceleration function

```
function f_J2_I =  J2P(rE, J_2, mu, r_I)

% ----------------------------------------------------------------
% J2P
% ----------------------------------------------------------------
% Description:
% Compute the spacecraft acceleration due to J2 perturbation ECI
% ----------------------------------------------------------------
% Inputs:
% r_I => components of r in ECI (3 x 1 matrix)
% ----------------------------------------------------------------
% Outputs:
% f_J2_I => components of the acceleration in ECI (3 x 1 matrix)
% ----------------------------------------------------------------
% Parameters:
% mu => gravitational constant of the Earth
% J_2 => J2 coefficient for oblate body of earth
% rE => Radius of earth
% ----------------------------------------------------------------

% J_2 equation
f_J2_I = 3*mu*J_2*rE^2/(2*(norm(r_I)^5))...
    *(...
    (5*(r_I(3)^2)/(norm(r_I)^2)-1)*r_I - 2*[0; 0; r_I(3)]...
    );

end
```
